

# Soft tissue Graft: Allograft(Donor) Tissue Graft

Periodontal Care, P.A.  
*Healthy Gums, Healthy Heart*

## Adequate Gum Tissue

Just like our skin protects our bodies from irritants, the gums serve the same purpose for the teeth and implants. If you do not have adequate gum support, you are at risk for pain, inflammation, and progressive attachment loss. If the area becomes too advanced to fix, removal of the tooth could be required.

## Donor Tissue

The donor tissue is sterile material that acts as a scaffold for your body to grow new tissue. You must have a good zone of your tissue to have a donor graft.

## Brushing Technique

Brushing too hard can lead to gum loss. Warm the toothbrush on your chewing surfaces first, then use a gentle circular motion on the outside.
